Introduction to Kubernetes

Features

Monolithic application

Server 1 Single process

Microservices-based application

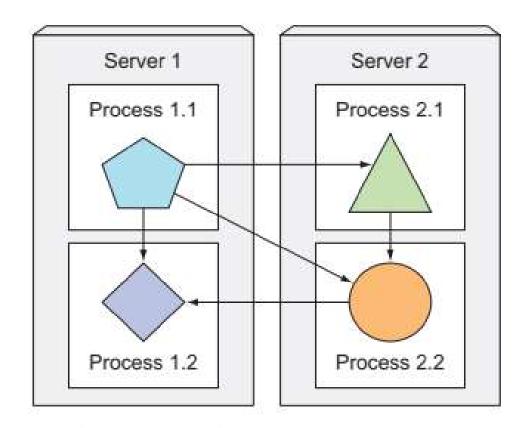

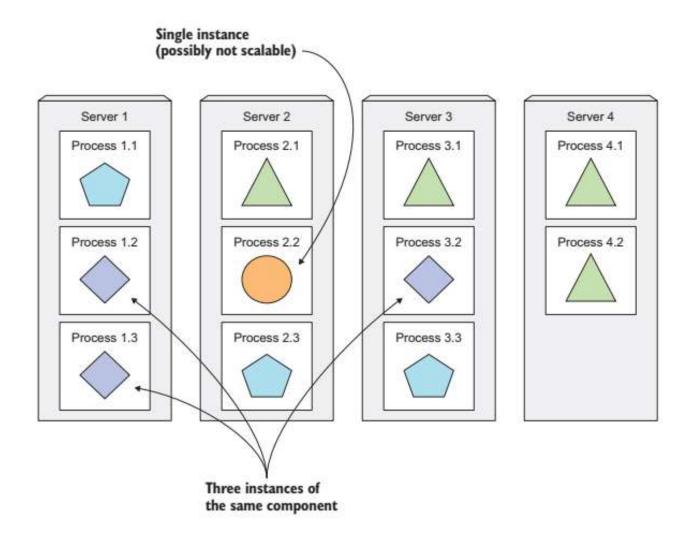

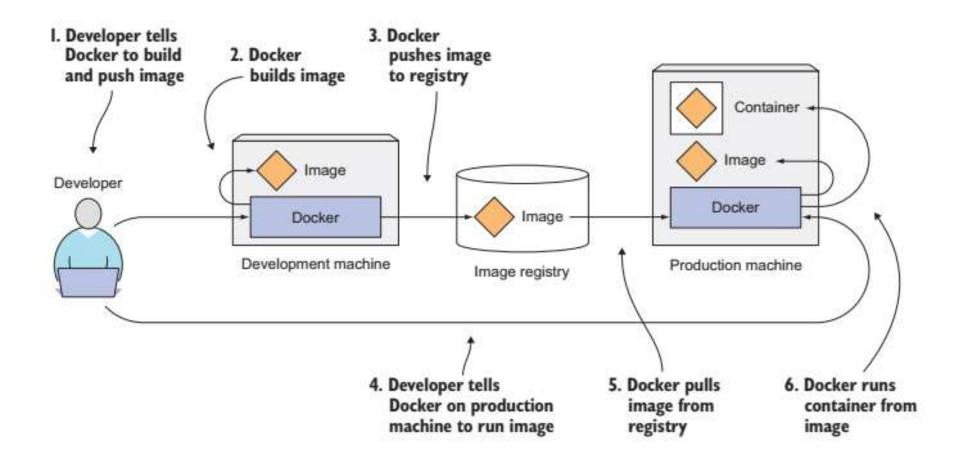

Figure 1.1 Components inside a monolithic application vs. standalone microservices

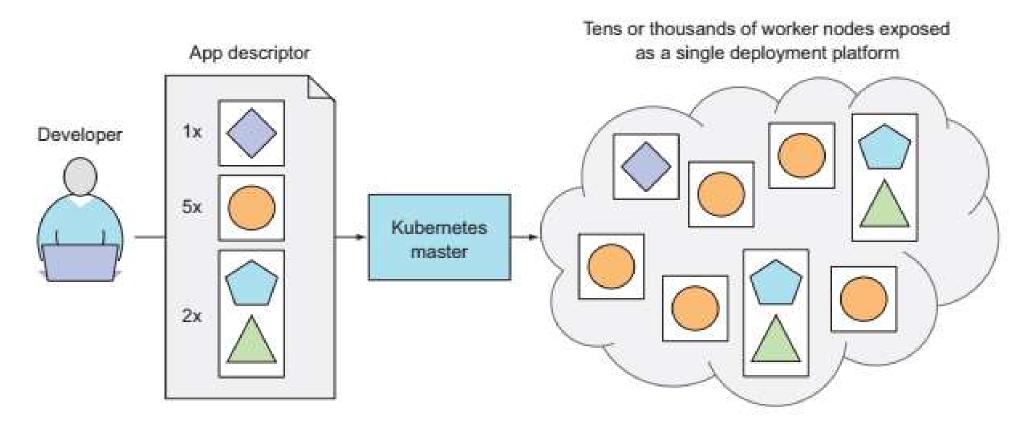

Figure 1.8 Kubernetes exposes the whole datacenter as a single deployment platform.

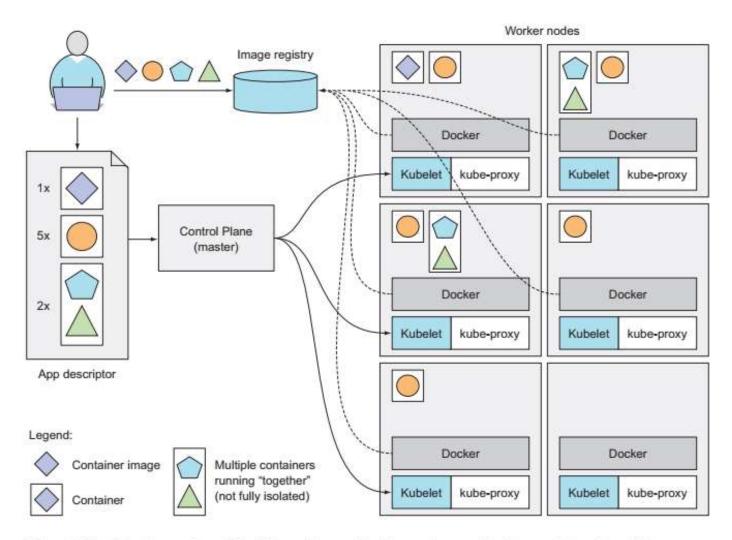

Figure 1.10 A basic overview of the Kubernetes architecture and an application running on top of it

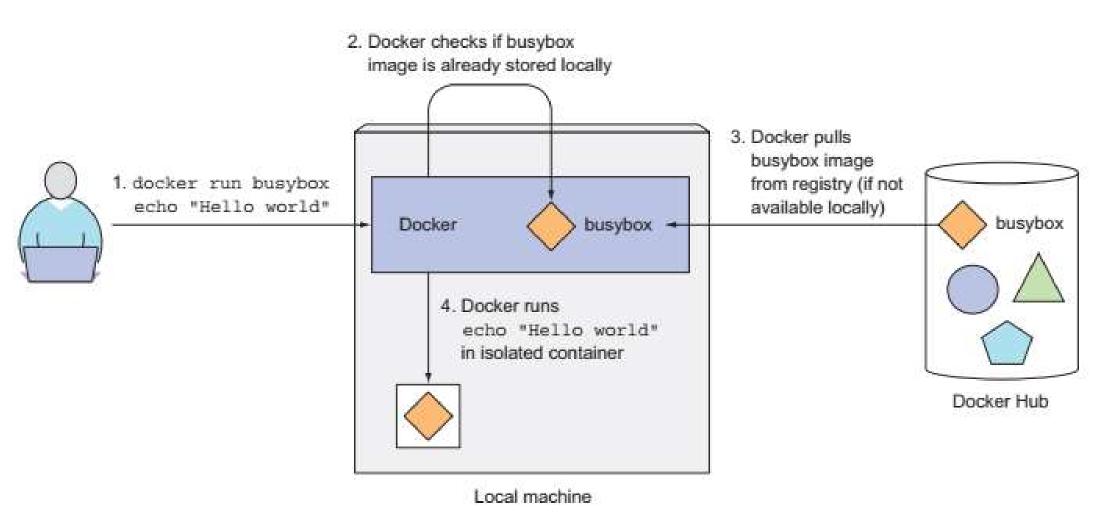

Figure 2.1 Running echo "Hello world" in a container based on the busybox container image

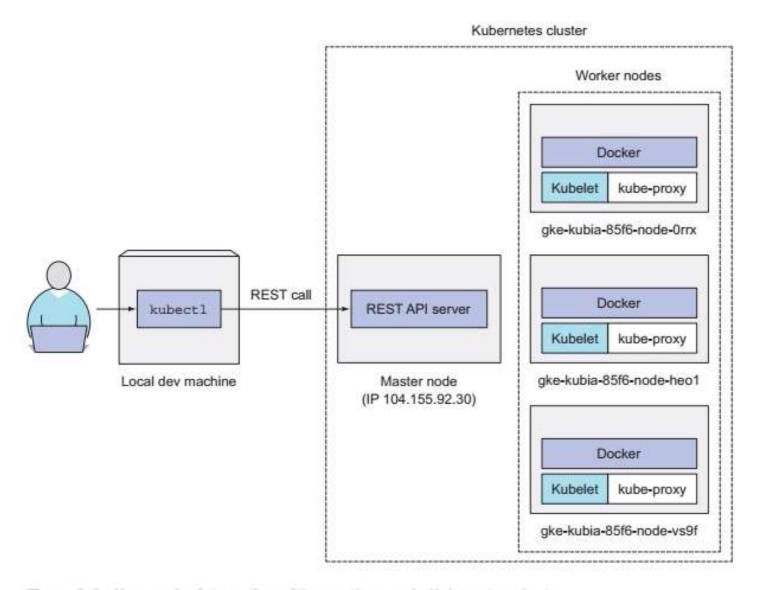

Figure 2.4 How you're interacting with your three-node Kubernetes cluster

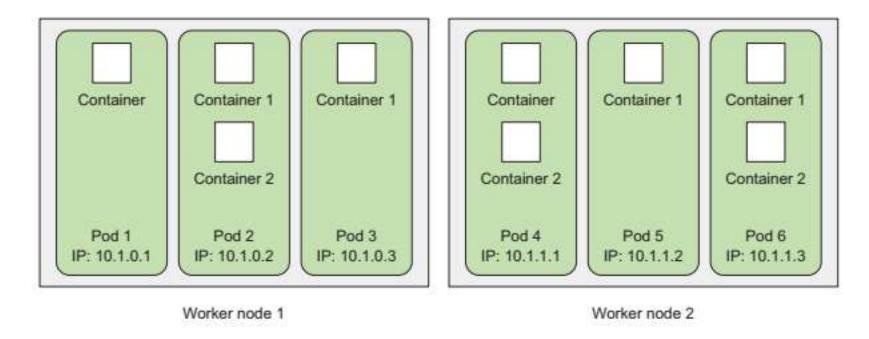

Figure 2.5 The relationship between containers, pods, and physical worker nodes

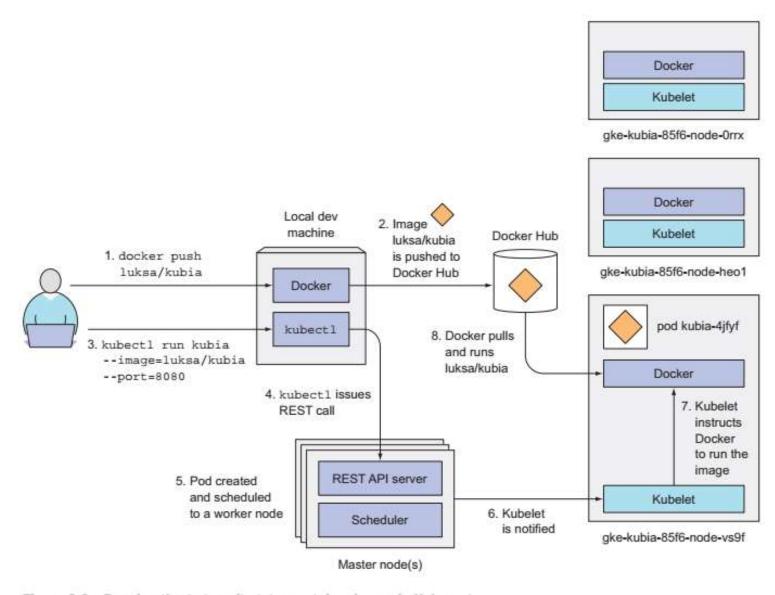

Figure 2.6 Running the luksa/kubia container image in Kubernetes

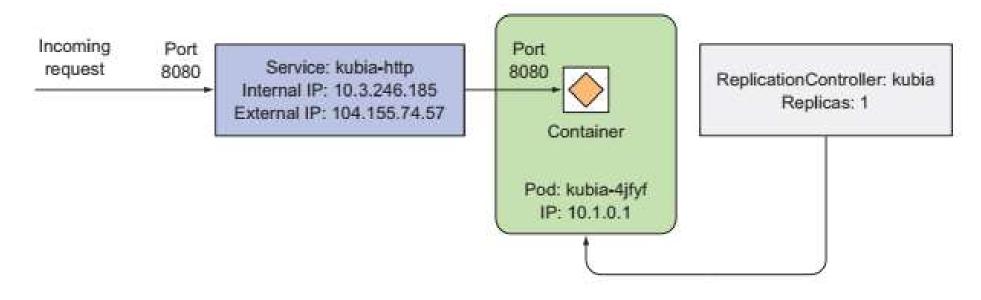

Figure 2.7 Your system consists of a ReplicationController, a Pod, and a Service.

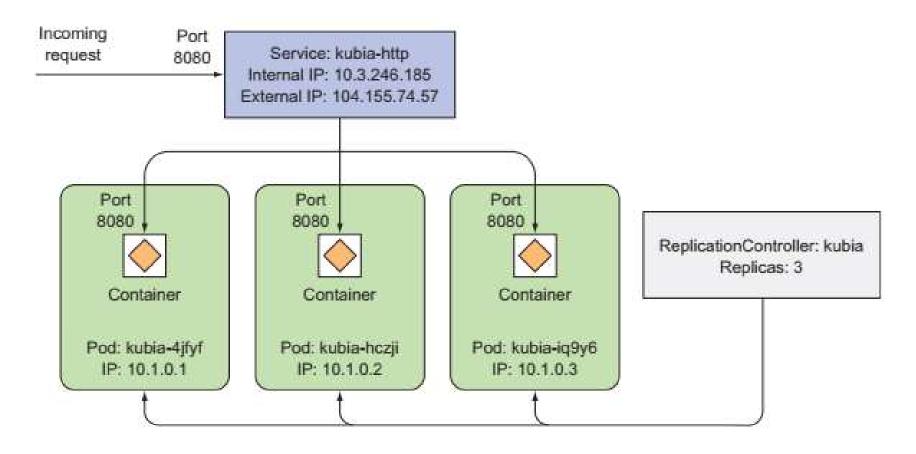

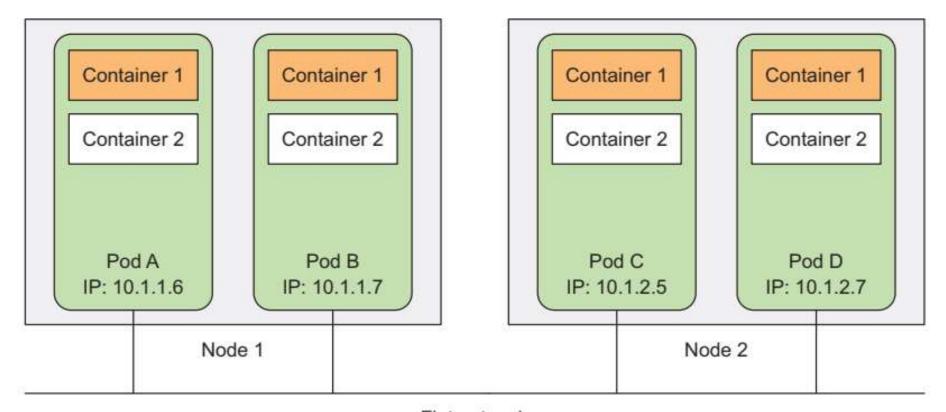

Figure 2.8 Three instances of a pod managed by the same ReplicationController and exposed through a single service IP and port.

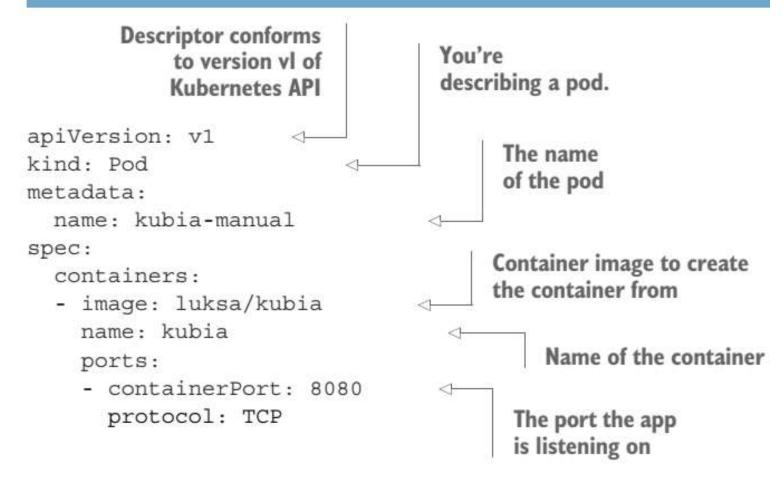

Flat network

Figure 3.2 Each pod gets a routable IP address and all other pods see the pod under that IP address.

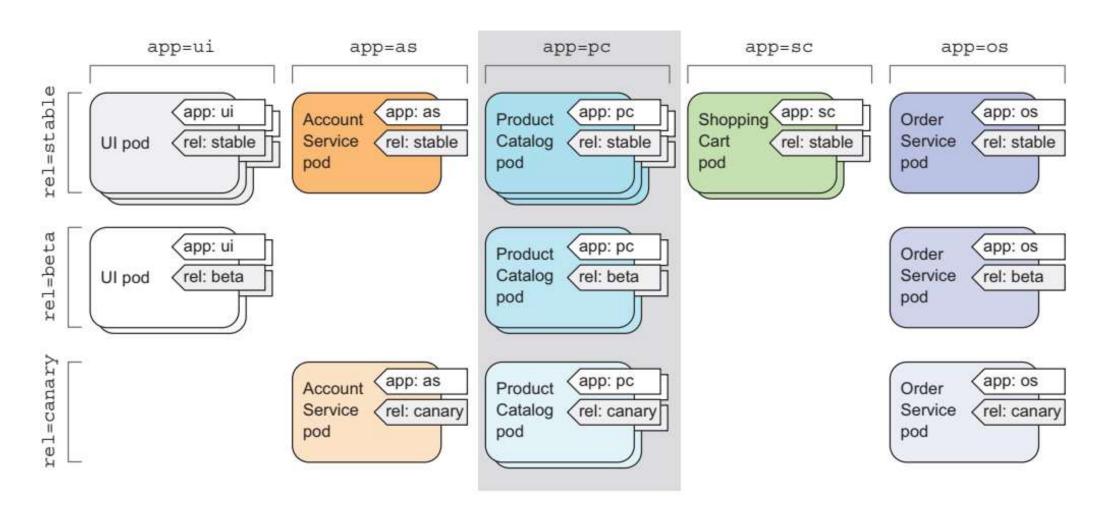

Figure 3.8 Selecting the product catalog microservice pods using the "app=pc" label selector

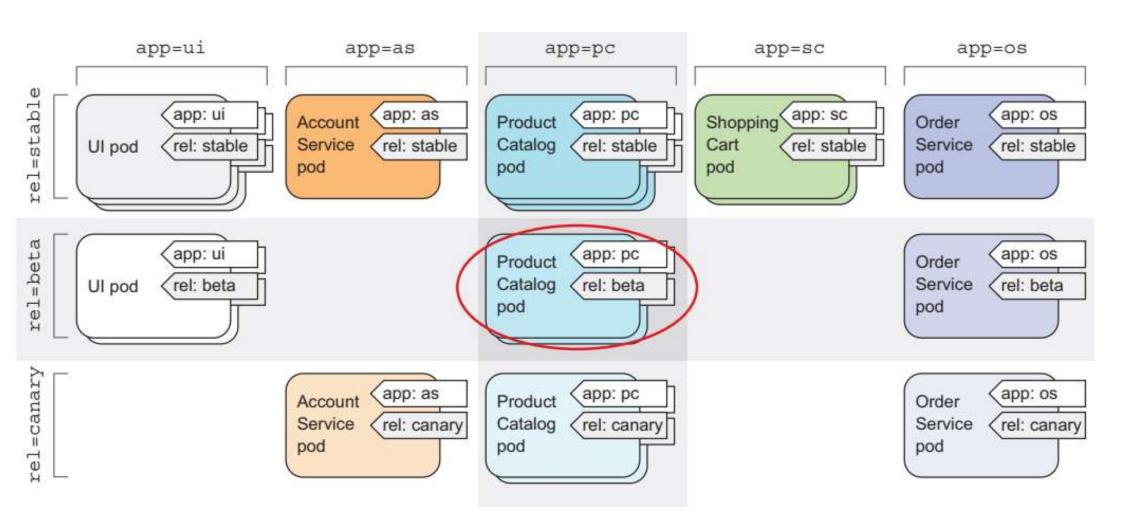

Figure 3.9 Selecting pods with multiple label selectors

20

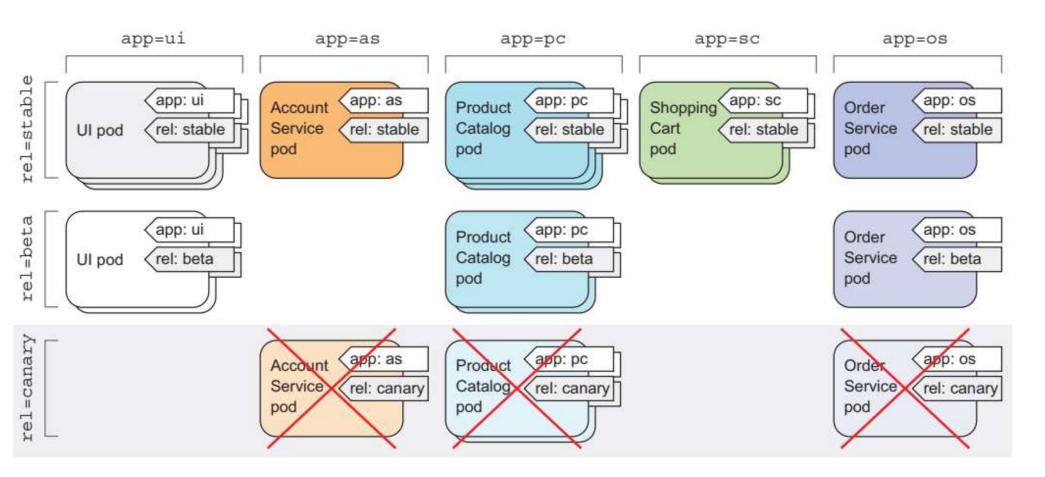

Figure 3.10 Selecting and deleting all canary pods through the relecanary label selector

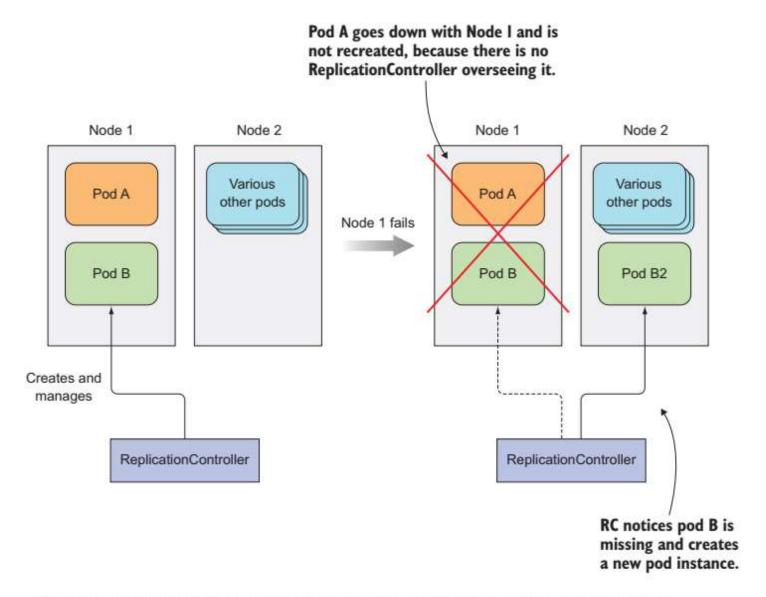

Figure 4.1 When a node fails, only pods backed by a ReplicationController are recreated.

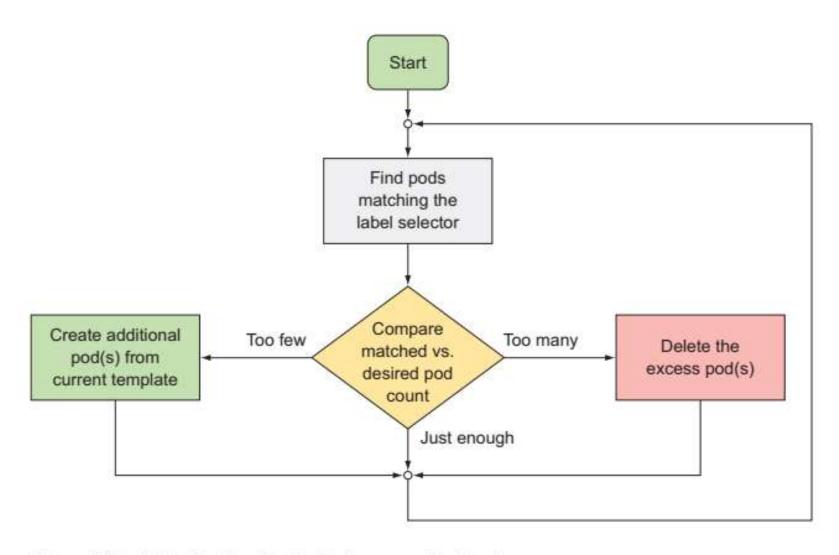

Figure 4.2 A ReplicationController's reconciliation loop

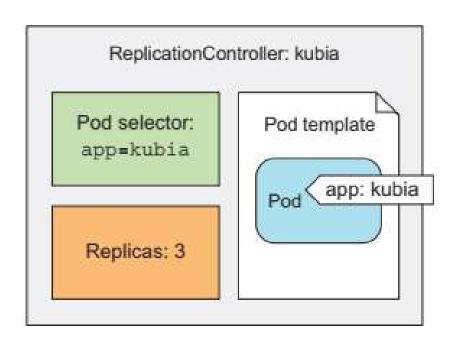

Figure 4.3 The three key parts of a ReplicationController (pod selector, replica count, and pod template)

Listing 4.4 A YAML definition of a ReplicationController: kubia-rc.yaml

```
This manifest defines a
                                                  ReplicationController (RC)
apiVersion: v1
                                                    The name of this
kind: ReplicationController
                                                    ReplicationController
metadata:
  name: kubia
                                                        The desired number
spec:
                                                        of pod instances
  replicas: 3
                                   The pod selector determining
  selector:
                                  what pods the RC is operating on
     app: kubia
  template:
    metadata:
      labels:
        app: kubia
                                     The pod template
    spec:
                                     for creating new
      containers:
                                     pods
      - name: kubia
        image: luksa/kubia
        ports:
        - containerPort: 8080
```

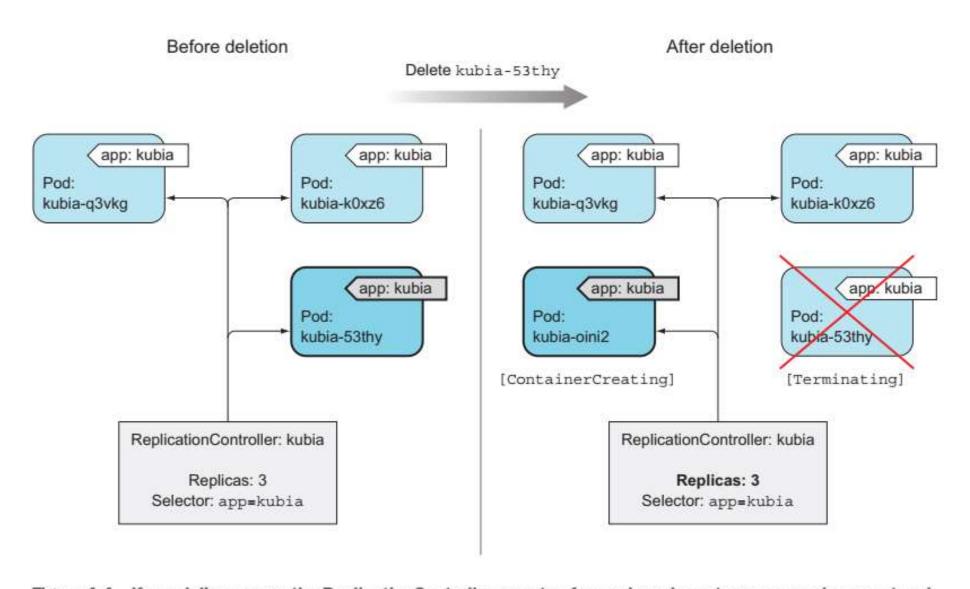

Figure 4.4 If a pod disappears, the ReplicationController sees too few pods and creates a new replacement pod.

25

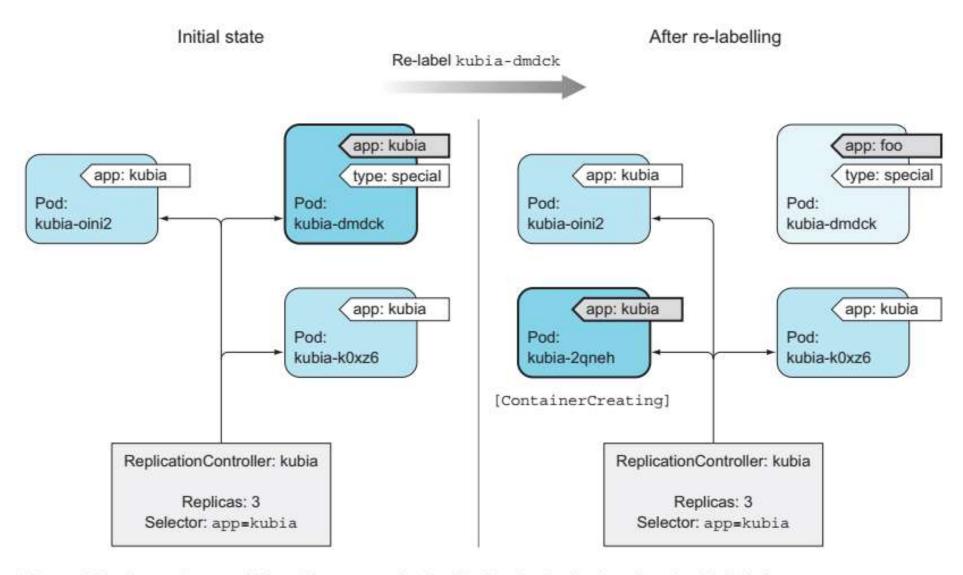

Figure 4.5 Removing a pod from the scope of a ReplicationController by changing its labels

Services

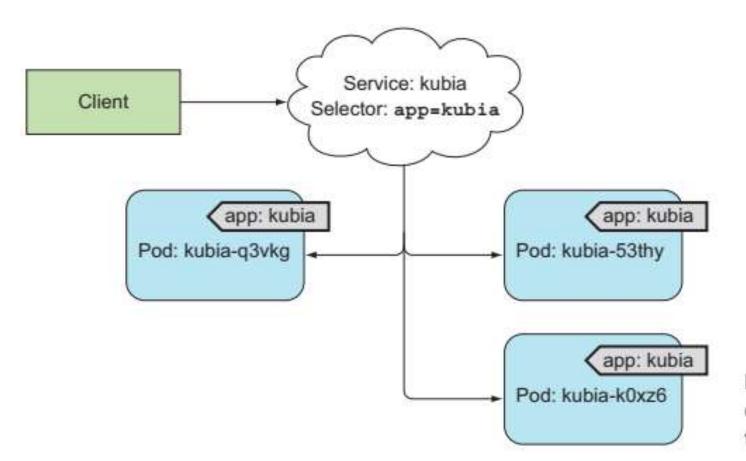

Figure 5.2 Label selectors determine which pods belong to the Service.

Listing 5.1 A definition of a service: kubia-svc.yaml

```
apiVersion: vl
                                 The port this service
kind: Service
                                 will be available on
metadata:
  name: kubia
spec:
                                      The container port the
  ports:
                                      service will forward to
  - port: 80
    targetPort: 8080
                                         All pods with the app=kubia
  selector:
                                         label will be part of this service.
    app: kubia
```

Kubernetes Architecture

6 July 2023

Kubernetes namespaces

- Provide for a scope of Kubernetes resource, carving up your cluster in smaller units
 - \$ kubectl get ns
 - \$ kubectl describe ns default
 - \$kubectl create namespace test

Thanks
